```
The present sequence encodes a secreted or transmembrane polypeptide.
The specification describes polypeptides designated PRO1484, PRO4334,
PRO4352, PRO1899, PRO1890, PRO1895, PRO4353, PRO4455, PRO4405,
PRO456, PRO4522, PRO4480, PRO4499, PRO4452, PRO4405,
PRO6030, PRO4424, PRO4422, PRO4430 and PRO4499. PRO1889 polypeptide is
useful for diagnosing tumour in a mammal. The polypeptides, their
agonists and antagonists are useful treating a condition associated with
expression or activity of the polypeptide. Conditions treated include
obesity, diabetes or hyper-or hypo-insulinemia. The polypeptides are
capable of inducing proliferation of mammalian kidney mesangial cells
and are therefore useful for treating kidney disorders associated with
decreased mesangial cell function such as Bergers disease or other
nephropathies associated with Schonlein-Henoch purpura, celiac disease,
c dermatitis herpetiformis or Crohns disease. The nucleic acids may be used
to generate transgenic animals for use in development and screening of
therapeutically useful reagents and also for chromosome identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pan J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel secreted and transmembrane polypeptides useful for diagnosing tumour in a mammal, for identifying agonists and antagonists of the polypeptide and for therapeutic use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gurney AL,

                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 38 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5766880

GENERAL INFORMATION:
APPLICANT: Cole, Susan P.C.
APPLICANT: Deeley, Roger G.
TITLE OF INVENTION: ISOLATED NUCLEIC ACID MOLECULES ENCODING TITLE OF INVENTION: MULTIDRUG RESISTANCE PROTEINS
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
ADDRESSEE: PARTEQ RESEARCH & DEVELOPMENT INNOVATIONS
STREET: Queen's University at Kingston
STATE: Onlean's University at Kingston
STATE: Onlean's University at Kingston
STATE: Onlean's University at Kingston
STATE: CONFUTER READABLE FORM:
MEDIUM TYPE: Eloppy disk
COMPUTER READABLE FORM:
MEDIUM TYPE: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: ASCII text
CURRENT APPLICATION DATA:
PFILING DATE: 05-JUN-1995
CLASSIFICATION: 435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       62; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Patent No. 5891724
GENERAL INFORMATION:
APPLICANT: Deley, Roger G.
APPLICANT: Cole, Susan P.C.
TITLE OF INVENTION: METHODS FOR CONFERRING MULTIDRUG
TITLE OF INVENTION: RESISTANCE ON A CELL
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:

Sequence 1, Application US/08461384B

Patent No. 6025473

GENERAL INFORMATION:
APPLICANT: Cole, Susan P.C.
APPLICANT: Deeley, Roger G.
TITLE OF INVENTION: MULTIDRUG RESISTANCE PROTEINS
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: PARTEQ RESEARCH & DEVELOPMENT INNOVATIONS
STREET: Queen's University at Kingston
CITY: Kingston
STATE: Ontario
COUTTY: CANADA
ZIP: K71 3NG
COMPUTER READABLE FORM:
MULTIDRUG RESISTANCE PROMESTICE
COMPUTE: FILOSOPHICALIONS
COMPUTE: 
COMPUTER: IBM PC compatible
OPERATING SISTEM: PC-DOS/MS-DOS
SOGFWARE: ASCII text
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/463,179A
FILING DATE:
CLASSIFICATION: 536
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 07/966,923
FILING DATE: 27-07-1992
APPLICATION NUMBER: 08/029,340
FILING DATE: 28-MAR-1993
APPLICATION NUMBER: 08/11,893
FILING DATE: 20-07-1993

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | S1DS1/gcgdata/geneseqn-embl/NA1982_DAT:*

The present sequence for T243 homologous sequence #1 is generated by PCR and is homologous to the T243 gene which encodes for a trinucleotide crepeat protein (TRP). The invention describes methods of producing capture (preferably gene T243) encoding a TRP and of target DNA sequence (preferably gene T243) encoding a TRP and of carget DNA sequence (preferably gene T243) encoding a TRP and of producing a knockout mouse comprising a homozygous disruption in a gene concoling TRP, where the disruption inhibits the producing of the wild encoding TRP. The invention also relates to identifying agents cappable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene cocoling TRP produces a phenotypic change. The transgenic animals and the cencelling TRP produces a phenotypic change. The transgenic animals and the calls are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, disease symptoms, and interventions which may be effective in the training trinucleotide repeat disorders e.g. fragile X syndrome and the training towarders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features observed in human disease. Using the mice, it is possible to model both per progression per per progression per per per progression per per per per pe
